1. Introduction

Electronic equipment sometimes "locks-up," requiring a service call just to flip the power switch to perform a simple reboot. The NBB-1600 Network Boot Bar gives you the ability to perform this function from anywhere, just point your browser to the NBB's IP address, enter the secure username and password, and you're just a click away from remote power On, Off or Reboot.

Intelligent Power Control
In addition to web browser access, the NBB-1600 can also communicate over any TCP/IP network using standard Telnet, or out-of-band using an external modem and basic VT100 type terminal emulation.

Security Features and Co-Location Features
To ensure security, web browser access requires the user to enter an assigned user name and password. This password uses basic 64 bit encryption techniques to assure secure access to your equipment.

The NBB-1600 provides two levels of operational passwords; the System Administrator Level, which allows access to all configuration and switching functions, and the User Level, which only allows access to assigned plugs and cannot be used to change unit configuration.

In addition to password security features, the NBB also includes an address specific IP security mask, which can also be employed to prevent unauthorized network access to the NBB command mode.

Easy to Configure, Easy to Use
The NBB-1600 can be configured over the network, via modem, or locally via the NBB console port. Easy to use commands let you assign a location name, set system parameters and view plug status. Outlets can be switched On, Off, or booted using plug numbers or names.

Reliability and Support
The NBB-1600 is built in the USA and backed by a two year warranty. NetReach products are installed in thousands of network sites world wide. Our customers know they can depend on WTI for superior quality and reliability for their most mission-critical operations.
Typographic Conventions

Throughout this manual, typefaces and characters have been used to denote the following:

**COURIER FONT** Indicates characters typed on the keyboard. For example, `/ON 3` or `/OFF 5`.

**[Bold Font]** Text set in bold face and enclosed in square brackets indicates a specific key. For example, `[Enter]` or `[Esc]`. 
2. Unit Description

As shown in Figure 2.1, the NBB-1600 unit includes power outlets, LED indicators, a manual plug switch button and other features. The items in Figure 2.1 are described on the following page.

Figure 2.1: NBB-1600 Unit (Some Plugs Not Shown)
Manual Switch Button: A Manual Control Button for the unit's switched plugs. To manually toggle all plugs "On" or "Off", press and hold the control button for three seconds.

Note: If desired, the Manual Control Button can also be disabled as described in Section 5.3.1.

Ready Indicator: Flashes when the NBB-1600 is ready to receive commands.

Activity Indicator: Flashes to indicate activity at the Network Port.

10BaseT (Network) Port: An RJ45 Ethernet Port for connection to your TCP/IP network. The default IP Address is 192.168.168.168. For more information, please refer to Section 5.3.4.

RS232 Console Port: A male, DB9, RS232 serial port (DTE), used for connection to a local terminal or external modem, as described in Section 4.3.

Master Power Switch: This switch must be "On" in order for the NBB to function. Note that this switch is not used to set the On/Off status of the switched outlets.

Switched Plugs and Plug Indicators: Sixteen (16) 115 VAC outlets, split into two power circuits. Circuit "A" includes plugs one through eight, and Circuit "B" includes plugs nine through 16. Each power circuit can switch a total load of up to 15 Amps.

Power Circuit "A" Components: An AC inlet and circuit breaker, which supply power to plugs one through eight. Includes the following:

- Power Inlet: A 115 VAC, IEC-320 AC inlet. Includes cable-keeper (Not Shown.)
- Circuit Breaker: 115 VAC, 15 Amps.

Power Circuit "B" Components: An AC Inlet and circuit breaker which supply power to plugs nine through sixteen. Includes same components as item 8, above.

Rack Mounting Brackets: (Not Shown.) Brackets for mounting the NBB-1600 to your equipment rack.
3. Quick Start

This section provides quick installation instructions for the NBB hardware. In order to take full advantage of the complete range of features offered by the unit, it is recommended to complete Sections 4 and 5 in addition to this Quick Start procedure.

3.1. Hardware Installation

1. **Connect Power Cables**: Connect the power cables (supplied with the unit) to the NBB's Circuit "A" and Circuit "B" Power Inlets, then connect the cables to an appropriate power supply. Place the Master Power Switch in the "On" position. After a brief pause, the plug indicators should switch "On."
   
   **CAUTION**: Prior to connecting power, make certain to review the safety precautions listed in Section 4.1.

   **Note**: If you will only be using plugs one through eight, then it is only necessary to connect Circuit "A" to your power supply. Likewise, if you will only be using plugs nine through sixteen, then it is only necessary to connect Circuit "B" to your power supply.

2. **Ready LED**: Check to make certain that the Ready indicator is blinking. This indicates that the NBB is operating properly, and is ready to receive commands.

3. **Connect to Control Device**: In order to switch plugs or select parameters, commands are issued to the NBB via either the Network Port or Console Port. Note that it is not necessary to connect to both the Network and Console Ports.
   
   a) **Network Port**: To communicate with the NBB via network, connect your 10Base-T or 100Base-T network interface to the NBB Network port. For more information, please refer to Section 4.4.

   b) **Console Port**: To communicate with the NBB via a Local PC, use the supplied null modem cable to connect your PC COM port to the NBB Console Port. For more information, please refer to Section 4.3.

4. **Test Manual Control Button**: Press the Manual Control Button and hold it down for three seconds; the sixteen AC Outlets should be switched Off or On. Note that Manual Control can also be disabled as described in Section 5.3.1.
3.2. Communicating with the NBB

The NBB-1600 offers two different user interfaces: a Web Browser Interface and a Text Interface. The Web Browser interface allows you to contact the NBB via a TCP/IP network using a standard, JavaScript enabled web browser (such as Internet Explorer.) The Text Interface consists of a series of ASCII text menus, which may be accessed via TCP/IP network, Local PC or external modem.

Notes:

• The NBB features a default IP Address (192.168.168.168) and a default Subnet Mask (255.255.255.0). This allows initial network access to command mode without first setting up the unit's network parameters (providing you are contacting the NBB from a node on the same subnet.) When attempting to access the NBB from a node that is not on the same subnet, please refer to Section 5.3.4 for further configuration instructions.

• Modem access is not discussed in this quick start guide. For instructions on connecting a modem to the NBB, please refer to Section 4.3.2.

1. Access the Command Mode: This procedure differs slightly, depending on whether you're contacting the NBB via the Web Browser Interface or Text Interface.

   a) Web Browser Interface: Start your JavaScript enabled Web Browser. Enter the NBB's default IP address (192.168.168.168) in your browser address bar and then press [Enter]. A password prompt will be displayed. Since at this point, the user name and password have not been defined yet, you can simply click OK without keying in a user name or password. The Plug Status Screen will be displayed as shown in Figure 3.1.

   b) Text Interface:

      i. Via Telnet: Telnet to the NBB's default IP address (192.168.168.168). The Plug Status Screen (Figure 3.2) should be displayed.

      ii. Via Local PC: Start your communications program (e.g., Hyperterminal) and then press [Enter]. The Plug Status Screen will be displayed as shown in Figure 3.2. The default communications parameters for the Console Port are 9600 bps, No Parity, 8 data bits, One stop bit.
Figure 3.1: Plug Status Screen - Web Browser Interface

Figure 3.2: Plug Status Screen - Text Interface
2. **Test Switching Functions:** You may wish to perform the following tests in order to make certain that the NBB is responding to commands.

   a) **Reboot Outlet:** If you are communicating with the unit via the Web Browser Interface, select the button in the "Boot" column for Plug 1, and then click on "Apply." If you are operating the unit via the Text interface, type `/BOOT 1` and press [Enter]. The status indicator for Plug 1 should go off, pause for a moment, and then go back on, indicating that the boot cycle has been successfully completed.

   b) **Switch Outlet Off:** From the Web Browser Interface, select the button in the "Off" column for Plug 1, and then click "Apply." From the Text Interface, type `/OFF 1` and press [Enter]. The status indicator for Plug 1 should go Off, indicating that the command has been successfully completed. Leave Plug 1 in the "Off" state, and then proceed to the next step.

   c) **Switch Outlet On:** From the Web Browser Interface, select the button in the "On" column for Plug 1, and then click "Apply." From the Text Interface, type `/ON 1` and press [Enter]. The status indicator for Plug 1 should then go back On, indicating that the command has been successfully completed.

3. **Log Out:** When you have finished communicating with the NBB unit it is important to always log off by issuing the appropriate NBB command, rather than simply closing your Telnet or communications program. When you log off using the proper NBB command, this ensures that the unit has completely exited from command mode, and is not waiting for the inactivity timeout to elapse before allowing additional connections.

   a) **Web Browser Interface:** Click on the "Log Out" button.

   b) **Text Interface:** Type `/X` and press [Enter].

This completes the introductory overview of the NBB Network Boot Bar. Please proceed to Section 4 and Section 5 for complete installation and configuration procedures.
4. **Installation**

This section provides further details regarding the connections that are made in the process of installing the NBB-1600.

4.1. **Power Supply Connection**

Use the power cord included with the unit to connect the NBB to an appropriate power supply. The NBB’s Master Power Switch must be "On" in order for the unit to operate.

To install the supplied "Cable Keepers", first, make certain that both power cables are disconnected from your power supply. Next, loosen (but do not remove) the two phillips head screws located directly above each power inlet. Connect the power supply cables to the NBB’s power inlets, then slip the Cable Keepers over each supply cable, so the notch on the top of each keeper lines up with each cable, and the two slots on the bottom of each keeper slide over the loosened screws. Tighten the phillips head screws to secure each cable keeper to the unit, make certain the cables are secure, and then connect the cables to your power supply.

⚠️ **CAUTIONS:**

- This device should only be operated with the type of power source indicated on the instrument nameplate. If you are not sure of the type of power service available, please contact your local power company.
- Reliable earthing (grounding) of this unit must be maintained. Particular attention should be given to supply connections when connecting to power strips, rather than directly to the branch circuit.
- Check nameplate ratings to ensure that there is no overloading of supply circuits that could have an effect on overcurrent protection and supply wiring.

4.2. **Connection to Switched Outlets**

Connect the power cord from each device that you wish to control, to a Switched AC Outlet on the NBB unit. Note that when power is applied to the NBB, the Switched Outlets will all initially be switched "ON". Plugs one through eight can switch a total of up to 15 amps, and Plugs nine through sixteen can also switch a total of up to 15 Amps.
4.3. Console Port Connection

The Console Port is a male, RS232C DB9 connector, wired in a DTE configuration similar to an AT computer. In the default state, the Console port is configured for 9600 bps, no parity, 8 data bits, one stop bit. The Console Port can be connected to either an external modem or a local PC, but not both items at the same time. Appendix A describes the Console Port interface.

4.3.1. Connecting a Local PC

When connecting the Console Port to a Local PC, note that the port uses a DTE configuration. After the Local PC has been connected, make certain to set the Port Mode to "Console" as described in Section 5.3.2.

4.3.2. Connecting an External Modem

When connecting directly to an external modem, use a standard AT to Modem cable. Make certain that the modem is initialized at the same default communications parameters as the NBB Console Port. Next, refer to Section 5.3.2 and set the Port Mode to "Modem". If necessary, you may also wish to redefine the Modem initialization command at this point as described in Section 5.3.2. Please refer to the modem’s user’s guide for more information.

4.4. Connecting the Network Cable

The Network Port is an RJ45 Ethernet jack, for connection to a TCP/IP network. Connect your 10Base-T cable to the Network Port. Note that the NBB includes a default IP address (192.168.168.168) and a default subnet mask (255.255.255.0.) When installing the NBB in a working network environment, it is recommended to define network parameters as described in Section 5.3.4.

Note: The NBB features a 10Base-T Interface. When connecting to a 100Base-T interface, most router switches will autosense to determine if the device is 100Base-T or 10Base-T, and then configure the network interface accordingly. If your router switch does not autosense, the network interface port must be manually set to 10Base-T.

This completes the NBB installation instructions. Please proceed to the next Section for instructions regarding unit configuration.
5. Configuration

5.1. System Mode and User Mode

In order to restrict access to sensitive command functions, the NBB features two operating modes; System Mode and User Mode.

- **System Mode**: Allows access to all configuration menus, switching functions and status screens. The System Mode Status Screens show On/Off conditions for all switched outlets, and list all currently defined system parameters.

- **User Mode**: Allows access to status screens and On/Off/Boot commands, but does not allow access to configuration functions. Users may only issue commands to, or view status of the plugs that are specifically allowed by their password.

The NBB will display a password prompt when the unit is contacted via the Console Port or Network Port. The password entered at this prompt determines whether the unit will start-up in System Mode or User Mode. If the System Password is entered, the System Mode will be active. If a Plug Password is entered, the User Mode will be active. The System Password is defined via the General Parameters menu (Section 5.3.1), and the Plug Passwords are defined via the Plug Parameters Menu (Section 5.3.3.)

**Notes:**

- If you wish to restrict access to configuration menus, you must define the System Password.
- If the System Password is not defined, the NBB will always start-up in System Mode.
- If the System Password is not defined, the Password Prompt will not be displayed when you access the NBB via the Text Interface. The prompt will always be displayed when the NBB is contacted via the Web Browser Interface.
- When the NBB is contacted via Web Browser, the password prompt will also include a field for the user name. If you have not defined a user name, then you may leave this field blank, and only the password is required to gain access to the unit. The user name prompt is not displayed when the unit is contacted via the Text Interface.
5.2. Communicating with the NBB

In order to configure the unit or invoke command functions, you must first connect to the NBB and access the command mode. As discussed in Section 3, the NBB offers two separate command interfaces: the Web Browser Interface, and the Text Interface.

The NBB also offers three different methods for accessing command mode; via network, via external modem, or via local console. The Web Browser Interface is only available when the NBB is contacted via network, and the Text Interface is available via network, modem or local PC. The sections that follow describe the procedure for accessing the Web Browser Interface or the Text Interface.

**Note:** Configuration functions are only available when you have logged into the NBB command mode using the System Password.
5.2.1. Accessing the Web Browser Interface

In order to issue commands via the Web Browser Interface, the NBB must be connected to a TCP/IP network, and your PC must be equipped with a JavaScript enabled web browser (such as Internet Explorer or Netscape Navigator.)

1. Start your JavaScript enabled Web Browser.
2. Key the NBB's IP address (default = 192.168.168.168) into the web browser's address bar, and then press [Enter].
3. **Password Prompt:** The NBB will display a prompt, which asks for your name and password.
   a) **Username:** If you have not previously defined a username, then this field should be left blank. A username is only required when one has been defined via the General Parameters menu.
   b) **Password:** Key in your System Password or Plug Password and then click "OK" (Note that Plug Passwords do not permit access to configuration functions.)
   c) If the System Password has not been defined, simply click the "OK" button without keying in a name or password.

If a valid password is entered, the Plug Status Screen will appear as shown in Figure 5.1.

5.2.2. Accessing the Text Interface

The Text Interface can be accessed via Network, modem or local PC. In order to access the Text Interface, your installation must include the following:

- **Access Via Network:** The NBB-1600 must be connected to your TCP/IP Network, and your PC must include a communications program (such as Hyperterminal.)
- **Access Via Modem:** An external modem must be connected to the NBB Console Port, and a phone line must be connected to the external modem. Your PC Must include a communications program.
- **Access Via Local PC:** Your local PC Must be connected to the NBB Console Port. Your PC must include a communications program.
To access command mode via the Text Interface, proceed as follows:

1. The NBB is transparent to parity and will accept 7 or 8 bit characters, and in the default state, will answer back at 8 bits, no parity. Make certain your communication program is set for the appropriate baud rate, bits, parity and Comm Port.
   a) Via Modem: Start your communications program. Dial the external modem connected to the NBB. Wait for the Connect message, then proceed to Step 2.
   b) Via Local PC: Start your communications program and press [Enter]. Wait for the connect message, then proceed to Step 2.
   c) Via Network: The NBB includes a default IP address (192.168.168.168), which allows you to contact the unit from any network node on the same subnet. When the NBB is installed in a working network environment, it is recommended that you redefine the IP Address, Subnet Mask, and Gateway Address as described in Section 5.3.4.
      i. Telnet to the NBB's IP address. For example, if the IP address is "192.168.168.168", then on a UNIX system, the Telnet command would be:
         
         $ telnet 192.168.168.168 [Enter]
         
         ii. If the Telnet connection is refused, this may mean that either the IP Security feature has denied the connection (See Section 5.3.4.1), or that the unit is operating on a 100BaseT network that does not autosense for 10BaseT devices (see Section 4.4.)

2. Password: If the System Password has been defined, the unit will display the Password Prompt. Key in either the System Password or Plug Password, and press [Enter]. If the System Password has not been defined, the prompt will not be displayed when the unit is accessed via the Text Interface. Note that the Password feature is case sensitive.

3. If a valid System Password or Plug Password is entered, the NBB will display the Plug Status Screen shown in Figure 5.2, followed by the Command Prompt.
   
   Note: The Plug Status Screen will not display actual passwords. The password column will read either "defined" or "undefined."
5.3. Configuration Menus

As described in the sections that follow, configuration parameters for the NBB can be selected via the Web Browser Interface or Text Interface. Although the Web Browser and Text Interface provide two separate means for selecting parameters, both interfaces allow access to essentially the same set of parameters, and parameters selected via one interface will also be applied to the other.

**Web Browser Interface:** Click the "Setup" button to gain access to the configuration menus; a row of buttons will be displayed along the left hand edge of the screen. Click the appropriate button to access the desired menu. Note the following:

- Newly selected parameters will not be activated until you click the "Apply" button.
- To return to the main status screen, click the "Switch Panel" button, located on the left hand side of the screen.

**Text Interface:** Refer to the Help Screen (/H) and then enter the appropriate command to access the desired menu. When the configuration menu appears, key in the number or letter for the parameter that you wish to define and follow the instructions in the resulting submenu. Note the following:

- To exit from a parameters menu, press the [Esc] key.

"H" for help.

NBB>
The following sections describe options and parameters that can be accessed via each of the configuration menus. Please note that essentially the same selection of parameters and options are available via both the Web Browser Interface and Text Interface.

Note: Configuration menus are only available when the System Mode is active. Configuration menus are not available if you have logged in using a Plug Password.

5.3.1. The General Parameters Menus

The General Parameters Menus allow you to select parameters such as the System Password, User Name, Site I.D. and other options.

Web Browser Interface: Click the "Setup" button to access the Setup Menus, and then click the "General Parameters" button. The General Parameters Menu will be displayed as shown in Figure 5.3.

Text Interface: Type /G and press [Enter]. The General Parameters Menu will be displayed as shown in Figure 5.4.

The General Parameters Menu allows the following to be defined:

- **System Password**: The NBB will display a password prompt when you attempt to access command mode. When the System Password is entered at log on, the System Mode will be active, allowing access to both switching functions and configuration menus. (Four to 16 Characters, Default = undefined.)

  Note: If the System Password is not defined, then the NBB will always start up in System Mode, and configuration functions will then be available to anyone who accesses Command Mode.

- **User Name**: (Optional) The User Name prompt allows you to set up an additional layer of security for web access to the command mode by requiring that users correctly enter a name in addition to a password. Note that the Username is only required when the unit is accessed via the Web Interface. (Four to 16 Characters, Default = undefined.)

- **Site ID**: Defines a brief text message, which can be used to describe the installation location of the NBB unit. (Up to 32 characters, Default = undefined.)
Command Echo: Enables/Disables command echo. When enabled, ASCII commands sent via the Text Interface to the NBB will be echoed back, allowing keystrokes to be displayed. Note that this feature applies primarily to the text interface, and has no visible effect on the Web Browser Interface. (Default = On.)

Inactivity Timeout: Determines how long the NBB will wait for additional commands during periods of inactivity. When the Timeout Period elapses, the user will be disconnected from the NBB command mode. (Default = 2 Minutes.)

Command Confirmation: When enabled, the NBB will display a confirmation prompt before executing certain commands. When disabled, the prompt will be suppressed. (Default = On/Enabled.)
• **Automated Mode:** When enabled, the NBB will execute On, Off, Boot, and exit commands without displaying a confirmation prompt, status screen or confirmation messages. For more information, please refer to Section 6.4. (Default = Off.)

  **Note:** When this option is enabled, security functions are suppressed, and users are able to access configuration menus and control plugs without entering a password. If security is a concern and the Automated Mode is required, it is recommended to use the IP Security feature (Section 5.3.4.1) to restrict access.

• **Manual Switch Button:** Enables and configures the manual plug control button. (Default = "On").
  - **Off:** Disables the manual switch button.
  - **On:** Enables the manual switch button.

• **Command Prompt:** Selects the prompt that is sent when the unit is contacted via Text Interface. This allows the NBB to easily adapt to software designed for use with our NPS or IPS products. The prompt can be "NBB", "NPS", or "IPS". (Default = NBB.)

• **Default Parameters:** Resets the NBB to default parameters. All menu selected parameters, including port names and passwords, will be cleared. This option is only available via Text Interface.

  **Note:** If this function is invoked via Network, the IP Address will not be reset until you break your network connection to the unit. If this function is invoked via Console Port or Modem Port, the NBB will wait for all existing network connections to terminate before resetting network parameters.

### 5.3.2. Serial (Console) Port Parameters Menu

The Serial (Console) Port Parameters Menus are used to configure the NBB's RS232 Console Port.

**Web Browser Interface:** Click the "Setup" button to access the Setup Menus, and then click the "Serial Parameters" button. The Serial Parameters Menu will be displayed as shown in Figure 5.5.

**Text Interface:** Type `/C` and press [Enter]. The Serial Parameters Menu will be displayed as shown in Figure 5.6.

The Serial Parameters Menu allows the following to be defined:

• **Baud Rate:** The console port baud rate. (Default = 9600 bps.)

• **Data:** The data bits setting. (Default = 8 Bits.)
Parity: The console port parity. (Default = None.)

Stop: The stop bits setting. (Default = 1 Bit.)

Note: When baud rate, data bits, parity, or stop bits are changed via the console port, new values will not be applied until you exit and then re-enter command mode.

Port Mode: Sets up the serial console port for use with either a local PC ("Console") or external modem ("Modem"). When Port Mode is set to "Modem" the initialization string will be sent every 15 minutes. (Default = Console.)

Modem Initialization String: A command string (up to 32 characters long) which can be sent out the console port to initialize an external modem. If Port Mode is set to "Console", the modem initialization string will not be sent. For more information on initialization commands, refer to the user's guide for your modem. (Default = \texttt{ATE0M0Q1&C1&D2S0=1})
5.3.3. Plug Parameters Menus

The Plug Parameters Menus are used to define Plug Names, Plug Passwords and boot / sequence delay times for each of the NBB’s sixteen Switched AC Outlets.

Web Browser Interface: Click the "Setup" button to access the configuration menus, then click the "Plug Parameters" button. The Plug Parameters Menu will be displayed as shown in Figure 5.7. To select the port that you wish to configure, first click the down arrow to display the drop down menu under "Select a Port." Next, scroll down the drop down menu, click on the port that you wish to configure, and click "Go."

Text Interface: Type /P n and then press [Enter] (Where n is the number or name of the plug you wish to configure.) The Plug Parameters Menu will be displayed as shown in Figure 5.8.

The Plug Parameters Menu allows the following parameters to be defined:

- **Plug Name**: Assigns a name to the plug. (Up to 32 Characters, Default = undefined.)
  
  **Note:** The Plug name cannot begin with a number, the dash character, or the slash or backslash characters. Plug names cannot contain nonprintable characters, or asterisks, colons, plus signs, spaces or quotation marks.

- **Plug Password**: Assigns a password to the corresponding plug. When this password is entered at login, the user will be able to issue commands to this plug, and any other NBB plug that shares the same password as described in Section 5.3.3.1 below. Note that this password does not allow access to configuration functions. (16 Characters, Default = undefined.)
  
  **Note:** Passwords cannot begin with the slash character, and cannot contain nonprintable characters, asterisks, colons, plus signs, spaces or quotation marks.

- **Boot/Seq. Delay**: When more than one plug is switched On/Off or a reboot cycle is initiated, the Boot/Sequence delay determines how much time will elapse between switching operations, as described in Section 5.3.3.2. (Default = One Half (.5) Second.)
5.3.3.1 Plug Passwords and Co-Location Features

The Plug Passwords, which are defined via the Plug Parameters Menu allow you to determine which plugs an individual user will be permitted to control. When a plug password is entered while logging into command mode, the user will be able to issue On/Off/Reboot commands to the corresponding plug, and to every other plug that shares this same password.

For example, if the plug password "switch" is defined for plugs 1, 2, and 3, then if you log into command mode using the password "switch", then you will be allowed to issue On/Off/Reboot commands to plugs 1, 2, and 3, but not plugs 4 through 16.

Note that the Plug Passwords do not allow access to configuration functions, and users are only allowed to view the status of the plugs permitted by their password.
5.3.3.2. The Boot / Sequence Delay Period.

The Boot / Sequence Delay value will be applied differently for Reboot operations as opposed to simple On/Off operations:

1. **Reboot Cycles:**
   a) **Single Plug:** The Boot/Seq. Delay determines how long the plug will remain Off before it is switched back On.
   b) **Several Plugs:** The Boot/Seq. Delay determines how long the plug will remain in the "Off" condition, and also how long the NBB will pause before proceeding to the next plug specified by the Reboot command.

2. **On/Off Switching:** The Boot/Seq. Delay determines how long the NBB will pause before proceeding to the next plug specified by the ON command.

**Examples:** Assume that the Boot / Sequence Delays for each plug have been set as follows: Plug = 1 Second, Plug 2 = 2 Seconds, Plug 3 = 5 Seconds, Plug 4 = 1 Minute, Plug 5 = 1 Second

If an "On" command is applied to plugs one through five, the NBB will respond as follows:

1. Turn On Plug 1, Wait 1 Second.
2. Turn On Plug 2, Wait 2 Seconds
3. Turn On Plug 3, Wait 5 Seconds
4. Turn On Plug 4, Wait 1 Minute
5. Turn On Plug 5

If a "Reboot" Command is applied to Plug 3, the NBB-1600 will respond as follows:

If a Reboot Command is applied to plugs one through five, the NBB-1600 will respond as follows:

1. Turn Off plugs one through five (short delay between plugs.)
2. Wait 1 Second, Turn On Plug 1, Wait 1 Second.
5. Wait 1 Minute, Turn on Plug 4, Wait 1 Minute.
6. Wait 1 Second, Turn on Plug 5.
5.3.4. Network Parameters Menus

The Network Parameters Menus are used to select the IP Address and other network communication parameters.

**Web Browser Interface:** Click the "Setup" button to access the Setup Menus, and then click the "Network Parameters" button. The Web Parameters Menu will be displayed as shown in Figure 5.9.

**Text Interface:** Type /N and press [Enter]. The Network Parameters Menu will be displayed as shown in Figure 5.10.
Notes:
- Although the Web Browser Interface and Text Interface both allow configuration of the same network parameters, note that for the Text Interface, the IP Security feature is configured via a separate submenu. For more information on IP Security, please refer to Section 5.3.4.1.
- Settings for network parameters depend on the configuration of your individual network. Contact your network administrator for appropriate settings.

The Network Parameters Menu allows the following parameters to be defined. Except where noted, all parameters listed here are available via both the Web Browser Interface and the Text Interface.

- **IP Address**: Defines the IP address for the NBB unit. (Default = 192.168.168.168.)
- **Subnet Mask**: Defines the Subnet Mask for the NBB unit. (Default = 255.255.255.0.)
- **Gateway Address**: Defines the Gateway Address for the NBB unit. (Default = undefined.)
- **Send MSS**: Defines the Maximum Segment Size that will be sent by the NBB. (Default = 536.)
- **IP Security**: Please refer to Section 5.3.4.1 for a detailed description of the IP Security feature.
- **MAC Address**: Displays the unit's MAC Address. Please note that this item only displays the assigned MAC Address, and cannot be used to redefine the address.

Notes:
- To display the Network Status Screen, which lists all current network connections to the NBB unit, Type /SN and press [Enter].
- To reset the Network Port, type /R and press [Enter].
5.3.4.1. IP Security Feature

The IP Security feature can be used to restrict unauthorized IP addresses from establishing a connection with the NBB. In the default state, the NBB accepts incoming IP connections from all hosts. To configure the IP Security feature, proceed as follows:

1. Access the IP Security Menu:
   
   a) **Web Browser Interface:** The IP Security feature is configured using the fields at the bottom of the Network Parameters Menu as shown in Figure 5.9.
   
   b) **Text Interface:** Go to the Network Parameters menu (/N), type 5 and press [Enter]. The IP Security menu will be displayed as shown in Figure 5.11.

2. The IP Security menu lists five IP Security "masks" along with the selected permit/deny action for each mask.
   
   a) Each Security Mask prompt defines a specific IP address or range of addresses. Each Mask Action prompt defines the permit/deny action for the corresponding mask.
   
   b) Masks are listed in order of ascending priority; Mask 1 has the lowest priority, Mask 5 has the highest priority.
   
   c) Masks have a cumulative effect; high priority masks supersede the effect of lower priority masks.
   
   d) Each IP Address consists of a series of four eight bit numbers. The number 255 is used as a wild card.

---

### IP SECURITY:

Enter selection. Press <ESC> to return to previous menu ...

Figure 5.11: IP Security Menu - Text Interface
Example 1: Deny access to all hosts except 192.1.1.5:

Security Mask #1: 255.255.255.255 Mask #1 Action: Deny
Security Mask #2: 192.1.1.5 Mask #2 Action: Permit

Since 255 is a wild card, Mask #1 blocks all IP Addresses. Mask #2 then specifically grants access to 192.1.1.5 only.

Example 2: Allow access only by addresses that begin with 192.

Security Mask #1: 255.255.255.255 Mask #1 Action: Deny
Security Mask #2: 192.255.255.255 Mask #2 Action: Permit

Since 255 is a wild card, Mask 1 blocks all IP addresses. Mask 2 then grants access to all addresses that begin with 192.

Example 3: Allow access only by addresses that begin with 192, deny access to 192.1.1.5.

Security Mask #1: 255.255.255.255 Mask #1 Action: Deny
Security Mask #2: 192.255.255.255 Mask #2 Action: Permit
Security Mask #3: 192.1.1.5 Mask #3 Action: Deny

Since 255 is a wild card, Mask 1 blocks all IP addresses. Mask 2 then grants access to all addresses that begin with 192. Finally, Mask 3 specifically blocks access by 192.1.1.5.

Note:

* Mask #5 has priority over the other four masks. If Mask #5 is set to deny access by "255.255.255.255" (all wild cards), you will not be able to access NBB Command Mode via network. Access will only be allowed via a Local PC or external modem connected to the NBB Console Port.
* When using the wild card address "255.255.255.255", make certain that at least one higher priority mask permits access by your IP address.

5.3.5. The Telnet Parameters Menus

The Telnet Parameters Menus are used to enable/disable Telnet access to the NBB command mode and select the TCP port for Telnet connections.

Web Browser Interface: Click the "Setup" button to access the configuration menus, and then click the "Telnet Parameters" button.

Text Interface: Type /T and press [Enter]. The Telnet Parameters Menu will be displayed.
The Telnet Parameters Menus allow the following parameters to be defined. Please note that all parameters listed here are available via both the Web Browser Interface and Text Interface.

- **Service:** Enables/Disables Telnet communication with the NBB unit. When this item is set to the “Off” condition, users will not be able to contact the unit via Telnet. (Default = On.)

- **Port Number:** Selects the TCP/IP port number that will be used for Telnet connections. (Default = 23.)

### 5.3.6. Web Server Parameters Menus

The Web Server Parameters Menus are used to configure the NBB's internal web server, which allows the unit to be operated via the Web Browser Interface.

- **Web Browser Interface:** Click the "Setup" button to access the configuration menus, and then click the "Web Server Parameters" button.

- **Text Interface:** Type `/W` and press `[Enter]`. The Web Server Parameters Menu will be displayed.

The Web Server Parameters Menu allows the following parameters to be defined. Please note that all parameters listed here are available via both the Web Browser Interface and Text Interface.

- **Service:** Enables/Disables the NBB's Web Server. Note that when the Web Server is disabled, you will not be able to communicate via the Web Browser Interface. (Default = On.)

- **Port Number:** Sets the TCP/IP Port Number. The Port Number can be set to any valid number except 23; this is because 23 is the default port number that is used for communication with the unit via Telnet. (Default = 80.)
5.4. Save Configuration Parameters

The NBB offers two methods for saving parameters; Saving to Memory, and Saving to an ASCII File.

Saving parameters to memory ensures that the user-defined configuration will remain intact if power to the NBB is temporarily interrupted. Normally, if parameters have been changed during the current session, the NBB will prompt you to save parameters before exiting from command mode. In this case, the NBB offers the option to either save parameters, exit without saving or revert to previously saved parameters.

Note however, that the NBB also includes command functions that can be used to save parameters to memory at any time, and that the Text Interface also provides the ability to recall previously saved parameters from memory. To save currently defined parameters to memory, proceed as follows:

- **Web Interface**: Click the Set Up Button to access the configuration menus. When the General Parameters menu appears, click the "Save Parameters" button.
- **Text Interface**: At the command prompt, type `/E` and press [Enter].

To abandon currently defined parameters and revert to previously saved parameters, access command mode via the Text Interface (System Mode only,) type `/R` and press [Enter].

Saving Parameters to an ASCII file allows you to create a "backup" of your currently defined configuration. For more information on saving parameters to an ASCII file, please refer to Section 7.

**Notes:**

- After new Parameters have been applied, the NBB will display a "Save" prompt. In the Web Browser Interface, this prompt appears when you leave the configurations menus. In the Text Interface, the "Save" prompt appears when you disconnect from the unit. At this point, you have the option of saving new parameters to memory, continuing without saving, or reverting to previously saved parameters.

- If parameters have not been saved, and if power to the NBB is interrupted, newly defined parameters will be lost. When power is restored, the unit will then be configured with the previously saved parameters.
6. Operation

As discussed in Section 5, "Configuration", the NBB offers two separate command interfaces; the Web Browser Interface and the Text Interface. Note that both interfaces offer essentially the same command options and features, and that parameters defined via the Web Interface will also apply when communicating via the Text Interface (and vice versa.)

6.1. Operation via the Web Browser Interface

When using the Web Browser Interface, all switching commands are invoked via the Plug Status Screen, which also displays the status of the NBB’s sixteen switched outlets.

6.1.1. The Plug Status Screen - Web Browser Interface

When you log on to the NBB command mode, using the Web Browser Interface, the first screen that is displayed after login is the Plug Status Screen (or "Switch Panel"). The Plug Status Screen (Figure 6.1) lists the current On/Off status of the NBB’s Switched Outlets and provides a series of "radio buttons" which are used to control On/Off/Boot switching of the outlets.

To invoke On/Off/Boot commands or view plug status via the Web Browser Interface, proceed as follows:

1. Access the NBB Command Mode as described in Section 5.2.1.

2. When the Plug Status Screen (Figure 6.1) appears, note that the screen includes a status field and On/Off/Boot controls for each of the NBB’s sixteen Switched AC Outlets.

Notes:

* When Boot/On/Off operations are initiated, Boot/Sequence Delay times will be applied as described in Section 5.3.3.2.

* Users who log in to command mode using a Plug password, will only be allowed to issue commands to the plugs allowed by that password.
3. **Switching Plugs On:** To switch one or more plugs On click the "On" radio button next to the desired plug(s), and then click the "Apply" button.

   a) To switch all Plugs On, select the "On" radio button in the "All Plugs" row, and then Click "Apply."

   b) The NBB will display a screen which indicates that the switching operation is in progress, and then return to the updated Plug Status Screen (which should now show the selected plugs in the On position.)

![Figure 6.1: Plug Status Menu - Web Browser Interface](image-url)
4. **Switching Plugs Off:** To switch one or more plugs Off, select the "Off" radio button next to the desired plug(s), and then click on the "Apply" button.
   a) To switch all Plugs Off, select the "Off" radio button in the "All Plugs" row, and then click "Apply."
   b) The NBB will display a screen which indicates that the switching operation is in progress, and then return to the updated Plug Status Screen (which should now show the selected plugs in the Off position.)

5. **Reboot Cycles:** To initiate a Reboot Cycle, click on the "Boot" radio button next to the desired plug(s), and then click the "Apply" Button.
   a) To reboot all Plugs, select the "Boot" button in the "All Plugs" line, and then Click "Apply."
   b) The NBB will display a screen which indicates that the Reboot Cycle is in progress, and then return to the Plug Status Screen (which should now show the selected plugs in the On position.)

### 6.2. Operation via the Text Interface

When using the Text Interface, all switching functions are performed by invoking simple, ASCII commands. ASCII commands are also used to display status screens and to log out of command mode. The Text Interface includes a Help Menu, which summarizes all available commands. To display the Text Interface Help Menu (Figure 6.3), type `/H` and press [Enter].

### 6.2.1. The Plug Status Screen - Text Interface

When you log in to the NBB command mode using the Text Interface, the first screen that is displayed after login is the Plug Status Screen. The Plug Status Screen (Figure 6.2) lists the current status of the NBB's Switched AC Outlets and displays the firmware version and currently defined Site I.D. Message.

Normally, the Plug Status Screen will also be redisplayed each time an On/Off/Boot command is successfully executed. Note however, that if desired, the Automated Mode (See Section 6.4) can be enabled to suppress the display of the Plug Status Screen after each command.
6.2.2. Boot/On/Off Commands - Text Interface

These commands can Boot or toggle the On/Off status of the NBB's switched plugs. Plugs may be specified by name or number.

Notes:

- Wait for the "NBB>" prompt to appear before entering commands. The prompt will not reappear until the previous command is complete.
- Commands are not case sensitive. All commands are invoked by pressing [Enter].
- Users who log in to command mode using a Plug password, will only be allowed to issue commands to the plugs allowed by that password.
- If command confirmation is enabled, the NBB will display the Status Screen after the Boot/On/Off commands are successfully completed.
- When Boot/On/Off operations are initiated, Boot/Sequence Delay times will be applied as described in Section 5.3.3.2.
To Switch Plugs, or initiate a Boot Cycle, proceed as follows:

1. **Switch Plug(s) On:** To power-on a plug, type `/ON n` and press [Enter]. Where "n" is the number or name of the desired plug. For example:
   
   `/ON 1` or `/ON ROUTER`

2. **Switch Plug(s) Off:** To power-off a plug, type `/OFF n` and press [Enter]. Where "n" is the number or name of the desired plug. Note that the "/OFF" command can also be entered as "/OF". For example:

   `/OFF 2` or `/OF ROUTER`

3. **Boot Plug(s):** To initiate a Boot cycle, type `/BOOT n` and press [Enter]. Where "n" is the number or name of the desired plug. Note that the "/BOOT" command can also be entered as "/BO". For example:

   `/BOOT 1` or `/BO ATMSWTCH`

4. **Suppress Command Confirmation Prompt:** To execute a Boot/On/Off command without displaying the "Sure?" prompt, include the ",Y" option at the end of the command line. For example:

   `/ON ROUTER,Y` or `/BOOT 2,Y`
6.2.3. Applying Commands to Several Plugs -
Text Interface

As described below, Boot/On/Off commands can be applied to only
one Switched AC Outlet, or to an assortment of outlets.

**Note:** When Boot/On/Off operations are initiated,
Boot/Sequence Delay times will be applied as
described in Section 5.3.3.2.

1. **Several Plugs:** To apply an On / Off / Boot command to
   several plugs, enter the numbers or names for the plugs,
   separated by a "plus sign" (+). For example to switch plugs 1,
   4, and 5 Off, enter the following:

   **/OFF 1+4+5 [Enter]**

2. **Series of Plugs:** To apply a command to a series of NBB
   Plugs, enter the number for the plugs that mark the beginning
   and end of the series, separated by a colon. For example, to
   switch plugs 1 through 3 On, enter the following:

   **/ON 1:3 [Enter]**

4. **All Plugs:** To apply a command to all plugs, enter an asterisk
   in place of the name or number. For example, to Boot all
   plugs, enter the following:

   **/BO * [Enter]**

6.3. Logging Out of Command Mode

When you are finished communicating with the NBB, it is important
to always disconnect using either the "Log Out" button (Web
Browser Interface) or /X command (Text Interface), rather than
simply closing your browser window or communications program.

When you disconnect using the Log Out button or /X command, this
makes certain that the NBB-1600 has completely exited from
command mode, and is not waiting for the inactivity timeout period
to elapse before closing the TCP/IP session. This ensures that all
available connections are free, and are not being tied up while
waiting for the no activity timeout to elapse.
6.4. The Automated Mode

The Automated Mode allows the NBB to execute switching and reboot commands, without displaying menus or generating response messages. Automated Mode is designed to allow the NBB to be controlled by a device which can generate commands to control power switching functions without human intervention.

When the Automated Mode is enabled, the /ON, /OFF, /BOOT, and /X commands are executed without a "Sure?" confirmation prompt and without command response messages; the only reply to these commands is the "NBB>" prompt, which is displayed when the command is complete.

Note that although the Automated Mode can be enabled using either the Web Browser Interface or Text Interface, Automated Mode is designed primarily for users who wish to send ASCII commands to the NBB without operator intervention, and therefore does not specifically apply to a GUI style, Web Browser Interface. When Automated Mode is enabled, the Web Browser Interface can still be used to invoke On / Off / Boot commands.

Notes:

• When Automated Mode is enabled, all NBB password security functions are disabled, and users are able to access System Level command functions (including the configuration menus) and control plugs without entering a password.

• If you need to enable Automated Mode, but want to restrict network access to the NBB unit, it is recommended to enable and configure the IP Security Function as described in Section 5.3.4.1.

To enable/disable the Automated Mode, access the General Parameters menu (see Section 5.3.1) and then set the "Automated Mode" option to the "On" state. When the Automated Mode is enabled, NBB functions will change as follows:

1. All Password Security Suppressed: When a user attempts to access the command mode via the Text Interface, the password prompt will not be displayed at either the Console or Network Port. Unless specifically restricted by the IP Security Function, all users will be allowed to access both switching and configuration functions, and all commands will be accepted without the requirement to enter a password.
2. **Status Screen Suppressed:** The status screens will not be automatically displayed after commands are successfully executed. Note however, that the /S command can still be invoked to display the status screen if needed.

3. **"Sure?" Prompt Suppressed:** All commands are executed without prompting for user confirmation.

4. **Error Messages Suppressed:** If the [Enter] key is pressed without entering a command, the NBB will not respond with the "Invalid Command" message. Note however, that an error message will still be generated if commands are invoked using invalid formats or arguments.

All other status display and configuration commands will still function as normal.

### 6.5. Manual Operation

In addition to the command driven functions available via the Web Browser Interface and Text Interface, the NBB's switched plugs can also be toggled On and Off manually. To manually toggle plugs On or Off, press the Manual Control Button, and hold it down for approximately three seconds.

If desired, the Manual Switch Button Option (accessed via the General Parameters Menu), can be used to completely disable the manual power button as described in Section 5.3.1.

For more information on the Manual Switch Button Parameter, please refer to Section 5.3.1.
7. Saving and Restoring Configuration Parameters

After the NBB has been properly configured, parameters can be downloaded and saved as an ASCII text file on your local or remote PC. Later, if the configuration is accidentally altered, the file with the saved parameters can be uploaded to automatically reconfigure the unit without the need to manually assign each parameter.

Saved parameters can also be uploaded to other NBB units. This allows rapid set-up when several units will be configured with the same parameters.

The "Save Parameters" procedure can be performed from any terminal emulation program (e.g. ProComm, Crosstalk, Hyperterminal, etc.), which allows downloading of ASCII files.

*Note:* Although this function is available only via the Text Interface, parameters that have been defined via the Web Browser Interface will also be sent to the ASCII file.

7.1. Sending Parameters to a File

1. Start your communications program and access the NBB command mode using the System Level Password.

2. When the NBB command prompt appears, type `/DL` and press `[Enter]`. The NBB will prompt you to prepare your communications program. Set up your communications program to receive an ASCII download, and specify a name for the file that will receive the saved parameters (e.g. NBB.PAR).

3. When the communications program is ready to receive the file, return to the NBB command mode, and press `[Enter]` to proceed.

4. The NBB will send a series of ASCII command lines which specify the currently selected NBB parameters.
7.2. Restoring Saved Parameters

This section describes the procedure for using ProComm to send saved parameters to the NBB.

**Note:** Parameters that have been saved to an ASCII file can only be restored via the Text Interface. This procedure cannot be performed via the Web Browser Interface.

1. Start your communications program and access the NBB command mode via the Text Interface as described in Section 5.2.2.

2. If the Password Prompt is displayed, key in your System Level Password and press [Enter].

3. Configure your communications program to upload an ASCII text file.

4. Upload the file with the saved parameters. If necessary, key in the file name and directory path.

5. When the upload is complete, make certain to terminate the communications program’s upload mode.

**Note:**
- The current On/Off status of each NBB plug will not be saved or restored. However, the selected default On/Off setting for each plug will be saved and restored.
- When the configuration file is sent to the NBB via telnet, the unit’s IP Address, Subnet Mask, and Gateway Address will not be changed until after you exit from command mode.
- If the Console port is active, the Baud Rate, Parity, Data Bits, and Stop Bits settings will not be changed until the user disconnects from the Console Port.

At this point, saved parameters should have been restored to the NBB unit. Check the Plug Status Screen, General Parameters Menu, Plug Parameters Menu and Network Parameters Menu to make certain that saved parameters have been accurately restored.
8. Upgrading NBB-1600 Firmware

When new, improved versions of the NBB firmware become available, the "Upgrade Firmware" function can be used to update the unit. Updates can be installed via the Console Port or Network Port.

**Notes:**
- The upgrade procedure can only be performed via the Text Interface.
- All other network ports will be disabled during the firmware upgrade procedure.
- When the upgrade procedure is complete, all parameters will be set to their default states. Therefore, it is recommended to save NBB configuration parameters to an ASCII file (as described in Section 7) before beginning this upgrade procedure.

1. Obtain the update file. Firmware modifications can either be mailed to the customer on a CDR, or downloaded from WTI. Place the upgrade CDR in your disk drive or copy the file to your hard drive.

2. Access the NBB command mode via the Text Interface. When the password prompt is displayed, key in the System Level Password.

3. When the command prompt appears, type `/U` and press [Enter]. The NBB will display a screen which offers the following options:

**Note:** Instructions regarding the proper Sector option will be supplied when upgrades become available.

- 1. Upgrade Sector 0
- 2. Upgrade Sectors 1 - 4
- 3. Upgrade Sectors 5 - 7
- 4. Abort Upgrade

Select the Sector Option indicated for the upgrade and press [Enter], or type 4 [Enter] to abort the upgrade procedure.
4. Set your communication program for ASCII Mode, then use the program's "Send File" function to transfer the upgrade file to the NBB. Select ASCII format, then specify the filename and directory location where the firmware upgrade file resides.

5. If the upload is successful, the NBB will load the upgrade firmware into memory, and then reboot itself.

   **Note:** If you are performing the upgrade procedure via the Network Port, the NBB will break the network connection when the system is reinitialized. However, the NBB will retain the current settings for the IP Address, the Telnet Port Number, Web Server Port Number and Console Port Mode and Baud Rate.

6. **Incomplete Upload:** If the upload is interrupted, times-out, or if the update file becomes corrupted during transfer, the NBB will display a screen which asks for confirmation before proceeding. To proceed, type 1 and press [Enter], then return to Step 4 above to retry the upload, or press [Esc] to reboot the NBB unit.

7. **Recovery Mode:** In the rare event that the NBB operating system becomes corrupted during installation, front panel indicators will blink, and the unit will automatically switch to Recovery Mode. If the unit switches to Recovery Mode, first access the NBB command mode to reset the Console Port to 9600 bps, Eight Data Bits, No Parity, One Stop Bit, and then return to step 3 above and repeat the upload procedure.

When firmware upgrades are available, WTI will provide the necessary files via download or mailed CDR. At that time, an updated User's Guide or addendum will also be available.
A. Interface Description

A.1. Serial Console Port Interface

![Diagram of RS232 Port Interface]

Figure A.1: Console Port Interface
B. Specifications

Power Input / Output:

AC Input: Two Separate Circuits; 15 Amps Max per circuit
- Voltage: 105 - 120 VAC, 60 Hz
- Connector: IEC-320 Inlet, Line Cord Supplied

AC Outputs: Sixteen (16) Plugs, split into two 15 Amp Circuits.
- Connectors: Sixteen (16) NEMA 5-15 Outlets
- Load: Power Circuit "A" (Plugs 1 to 8) - 15 Amps Total
  Power Circuit "B" (Plugs 9 to 16) - 15 Amps Total.

Serial Console / Modem Port Interface:

Connector: DB9M, RS232C, DTE
Coding: Serial ASCII, 8 Bits, No Parity

Physical / Environmental:

Size:
- Length: 43.75" (111.1 cm)
- Depth: 3.00" (7.6 cm)
- Width: 1.75" (4.5 cm)

Weight: 12 lbs. Shipping Weight
Temperature: (Operating) 32°F to 122°F (0°C to 50°C)
Humidity: 10 - 90% RH
C. Customer Service

Customer Service hours are from 8:00 AM to 5:00 PM, PST/PDT, Monday through Friday. When calling, please be prepared to give the name and model of the unit, its serial number and a description of its symptoms. If the unit should need to be returned for factory repair it must be accompanied by a Return Authorization number from Customer Service.
