Warnings and Cautions:

No Serviceable Parts Inside; Authorized Service Personnel Only

Do not attempt to repair or service this device yourself. Internal components must be serviced by authorized personnel only.

- Shock Hazard - Do Not Enter

Nameplate Power Warning

This device should only be operated with the type of power source indicated on the instrument nameplate. If you are not sure of the type of power service available, consult your local power company.

- Connect unit only to a properly measured supply. Use only three wire cord which is provided with the unit.

- Reliable earthing of this equipment must be maintained. Particular attention should be given to supply connections when connecting to power strips, rather than direct connections to the branch circuit.

Rack Mount Installation

When installing this device in an instrument rack, the following factors must be accounted for:

1. Enclosed Racks: Enclosed racks must provide adequate ventilation. Make certain that the rack is not overly crowded and note that each unit in the rack generates its own heat. An enclosed rack should have louvered sides and a fan to circulate cooling air.

When mounting the unit in an enclosed rack with a ventilation fan at the top of the rack, note that excessive heat generated by devices at the bottom of the rack can be drawn upward and into the ventilation slots of units located at the top. Make certain to provide adequate ventilation for equipment installed at the bottom of the rack.
Rack Mount Installation (Continued)

1. Enclosed Racks (Continued):

The ambient within the rack may be greater than room ambient. Installation should be such that the amount of air
flow required for safe operation is not compromised. The
maximum temperature for the equipment in this
environment is 45°C. Consideration should be given to the
maximum rated ambient.

Installation should be such that a hazardous stability
condition is not achieved due to uneven loading.

2. Open Racks: Make certain that the rack frame does not
block the ventilation slots on the instrument cover. If the
device is installed on sliders, check the unit when seated
all the way into the rack to make certain that ventilation
slots are not blocked.

Ventilation

Slots in the instrument cover are provided to allow ventilation
for heat dissipation. To ensure safe, reliable operation, these
openings must not be covered or blocked.

Disconnect Power

If any of the following events are noted, immediately disconnect
the unit from the outlet and contact qualified service personnel:

1. If the power cord becomes frayed or damaged.

2. If liquid has been spilled into the device or if the device
has been exposed to rain or water.

1. Introduction

Network equipment sometimes "locks-up", requiring a service call just to flip the power switch to perform a simple reboot. The NPS-2HD Heavy Duty Network Power Switch gives you the ability to perform this function from anywhere on the LAN/WAN, or if the network is down, to simply dial-in from a modem for out-of-band power control.

Intelligent Power Control
The NPS-2HD can communicate over any TCP/IP network using standard Telnet, or out-of-band using an external modem and terminal emulation. Each outlet can be assigned an individual password, device name, reboot delay time and unique power-up default status.

Security
Address specific IP security masks prevent unauthorized users from accessing the NPS command menu via network. The NPS provides two separate password security levels; System level and User level. The System password allows access to all configuration and command functions. The User password allows limited access to command functions.

Easy to Use, Easy to Configure
The NPS can be configured over the network, via modem, or locally via the NPS Console Port. Easy-to-use commands let you assign a location name, set system parameters and view plug status. Outlets can be switched On, Off, or Booted using plug numbers or names.

Features:
- Dual 20 Amp Circuits
- On/Off/Reboot Switching
- Integral 10Base-T Interface
- RS232 Modem and Console Ports
- Outlet-Specific Password Security
- Network Security Features
- Manual On/Off Buttons
Typographic Conventions

Throughout this manual, typefaces and characters have been used to denote the following:

- **COURIER FONT** Indicates characters typed on the keyboard. For example, /ON 1 or /OFF 2.

- **[Bold Font]** Text set in bold face and enclosed in square brackets indicates a specific key. For example, [Enter] or [Esc].
2. Unit Description

2.1. Front Panel

As shown in Figure 2.1, the NPS-2HD front panel includes a series of LED indicators which function as follows:

![Front Panel Diagram]

Figure 2.1: Front Panel

1. **ON**: Lights when AC Power is applied to the NPS-2HD.
2. **RDY**: Flashes when the NPS-2HD is ready to receive commands.
3. **RXD**: Lights when the NPS-2HD receives commands.
4. **DCD**: Lights when the Modem Port detects the Carrier.
5. **NET**: Lights when a Telnet session is in progress.

6. **Plug Indicators and Manual Control Buttons**: An On/Off Indicator and Manual Control Button for each switched plug. To manually switch a plug "On" or "Off", press and hold the appropriate Manual Control Button for one second; the corresponding plug will be toggled On or Off.

**Note**: If desired, the Manual Control Buttons can also be disabled as described in Section 5.4.
2.2. Back Panel

Bus 2 (Plug 2): Includes the following components:

A) Power Inlet: Supplies power for Bus 2.
B) Circuit Breaker: 115 VAC, 20 Amps
C) Switched Outlet: Each bus can switch up to 20 Amps.

Bus 1 (Plug 1): Same as Item 1 above, except the Bus 1 Power Inlet supplies power to Bus 1.

Network Port and Activity Indicator: A 10BaseT, RJ45 Ethernet port for connection to your TCP/IP network. To communicate via Network, you must first specify network parameters as described in Section 5.6.

Note: The NPS-2HD features a 10BaseT interface. When connecting the NPS to a 100BaseT interface, note that most 100BaseT router switches will autosense to determine if the device is 100BaseT or 10BaseT and then configure the network interface accordingly. If your router switch does not autosense, then the network interface port must be manually set to 10BaseT.

Modem Port: A Male RS-232, DB9 Connector, DTE configuration. For connection to an external modem.

Console Port: A Male RS-232, DB9 Connector, DTE configuration. For connection to a local PC.

Option Switches: A bank of four DIP Switches which select default settings for the baud rate and other features.

Default Button: Used in conjunction with the Reset Button to reset the unit to defaults (see Section 4.3.)

Reset Button: Used in conjunction with the Default Button to reset the unit to defaults (see Section 4.3.)
3. Quick Start Guide

This section provides a brief overview of basic NPS-2HD capabilities, and describes a simple test that can be performed to determine if the unit is operating properly and demonstrate basic communication capabilities.

Note that this Quick Start procedure is included only to provide a quick demonstration of basic NPS-2HD capabilities. In order to take full advantage of the complete range of features provided by this unit, it is strongly recommended that you should complete the entire Installation and Configuration sections after completing the Quick Start procedure.

1. **Apply Power to the NPS-2HD:** Connect the NPS-2HD to an appropriate power source. Prior to connecting the unit to your power supply, make certain to review the safety precautions listed at the beginning of this User's Guide and the cable clamp installation instructions in Section 4.1.

2. **Connect a PC to the NPS-2HD:** Attach a standard null modem cable from your PC COM port to the Console Port connector on the NPS back panel. For a description of the port interface, please refer to Appendix A.

   **Note:** When the NPS-2HD is shipped from the factory, Console Port communication parameters are set as follows: 9600 bps, 8 Data Bits, One Stop Bit, No Parity. Although the NPS-2HD allows these parameters to be easily redefined, for this Quick Start procedure, it is recommended that you configure your communications program to accept these default parameters.

3. **Access the Command Mode:** Start your communications program and then press [Enter]; the System Help Screen should be displayed (Figure 3.1) and the NPS command prompt should appear. For more information on command mode access, please refer to Section 5.2.
4. **Configure Network Port:** In order to allow communication with the NPS-2HD via the Network Port, you must first define the IP Address, Subnet Mask, and Gateway Address. At the NPS command prompt, type `/N` and press [Enter] to display the Network Parameters menu.

   a) Settings for network parameters will depend on the configuration of your individual network. Please contact your network administrator in order to determine the appropriate settings for the IP Address, Subnet Mask, and Gateway Address.

   b) To assign network parameters, key in the number for the desired parameter, press [Enter], and then follow the instructions in the resulting submenu. For example, to define the IP Address, type 1 and press [Enter].
5. **Exit Command Mode:** When you have finished setting Network Parameters, type `/X` and press **[Enter]** to exit the command mode at the Console Port.

**Note:** Only one port may access the NPS command mode at a given time. In order to allow access to the NPS unit via other ports, always exit from the command mode when you are finished communicating with the unit.

6. **Connect Network Cable:** Connect your network interface to the NPS-2HD Network Port. The Network Port is an RJ45, 10BaseT Ethernet jack, for connection to a TCP/IP network.

**Note:** The NPS-2HD features a 10BaseT Interface. When connecting to a 100BaseT interface, note that most router switches will autosense to determine if the device is 100BaseT or 10BaseT, and then configure the network interface accordingly. If your router switch does not autosense, then the network interface port must be manually set to 10BaseT.

7. **Network Access:** Telnet to the NPS's IP address. For example, if the IP address is "119.1.1.1", on a UNIX system the Telnet command would be invoked as follows:

```
$ telnet 119.1.1.1 [Enter]
```

After the Telnet connection is established, the NPS should display the System Help Screen and the NPS command prompt should appear, indicating that you have successfully accessed the NPS Command Mode via the Network Port.
8. **Test Boot Commands:** When the NPS-2HD is powered up, both switched plugs will be set in the ON position. In order to test for proper operation, you may wish to perform the following test. Note that it is not necessary to connect a device to either switched outlet in order to perform this test.

   a) **Reboot Plugs:** To initiate a boot cycle at both plugs, go to the NPS command prompt and type `/BOOT *` and press [Enter]. Power to both plugs will be switched OFF. After the Boot Delay Period (Default = 5 Seconds), the power to both plugs will then be automatically switched back ON. Note that the Plug Status Indicators on the NPS-2HD front panel will also switch Off and On.

   b) **Switch Plugs OFF:** To switch both plugs OFF, go to the NPS command prompt, type `/OFF *` and then press [Enter]. Power to both plugs will be switched OFF. Note that the Plug Status Indicators will also be switched Off.

   c) **Switch Plugs ON:** To switch both plugs ON, go to the NPS command prompt, type `/ON *` and then press [Enter]. Power to both plugs will be switched ON. Note that the Plug Status Indicators will also be switched On.

9. **Exit Command Mode:** Type `/X` and press [Enter] to exit from the NPS Command Mode, or disconnect using your Telnet program.

This completes the introductory overview of the NPS-2HD. Prior to installing and operating the unit, please review the remainder of this User’s Guide for important information regarding safety considerations, as well as more detailed installation, configuration, and operation instructions.
4. Installation

4.1. Power Connection

Note that the NPS-2HD features two separate 20 amp buses. In order for both buses to function, power must be connected to both input connectors on the unit's back panel.

Prior to connecting power supply cables to the unit, please refer to the cautions below, and the cable clamp installation instructions in Sections 4.1.1 and 4.1.2.

⚠️ CAUTIONS: ⚠️

- This device should only be operated with the type of power source indicated on the instrument nameplate. If you are not sure of the type of power service available, please contact your local power company.
- Reliable earthing (grounding) of this unit must be maintained. Particular attention should be given to supply connections when connecting to power strips, rather than directly to the branch circuit.

"Always On" Architecture: The NPS-2HD features "Always On" architecture. This means that once the NPS-2HD is connected to your power supply, both plugs will always be set in the ON state, unless program commands or the Manual Control Buttons have been used to switch the plug(s) to the OFF state.

4.1.1. Cable Clamp Installation

⚠️ CAUTIONS: ⚠️

- Make certain that the unit is disconnected from the power source before beginning this procedure.
- In order to reduce the chance of injury due to electric shock, the Output Cables should be installed before the Input Cables.
4.1.2. Output Cable Clamp

1. **Loosen Screws:** Locate the two screws which secure each output jack to the NPS-2HD back panel. Carefully loosen each screw to provide sufficient room for the cable clamp to be attached after it is fitted to the cable.

   **Note:** Make certain to loosen the screws enough to allow the cable clamp to be installed, but do not entirely remove the screws from the NPS back panel.

2. **Connect Plug:** Plug the power cable from your AC powered device into the output jack. Make certain that the plug is firmly seated. Note that the total load for each outlet must not exceed 20 amps.

3. **Fit Clamp to Plug:** Carefully slip the output cable clamp (See Figure 4.1) over the output plug, making certain that the two slots at the base of the clamp are properly seated over the screws which secure the output jack to the back panel. The U-shaped cutout, located at the back of the clamp, should face downwards in order to allow the clamp to fit over the cable.

4. **Tighten Screws:** Tighten the screws which secure the output cable clamp to the output jack.

---

*Figure 4.1: Output Cable Clamp Installation*
4.1.3. Input Cable Clamp

1. **Loosen Screws:** Locate the two screws which secure each input jack to the NPS-2HD back panel. Carefully loosen each screw to provide sufficient room for the input jack clamp to be attached.

   **Note:** Make certain to loosen the screws enough to allow the clamp to be installed, but do not entirely remove the screws from the NPS back panel.

2. **Attach Clamp to Jack:** Slip the input clamp into place, making certain that the screw slots in the base of the clamp are securely seated over the screws which secure the input jack to the back panel. Make certain to position the clamp so the retaining screw (see Figure 4.2) is facing upwards. Tighten the screws to secure the clamp to the input jack.

3. **Connect Plug:** Slide the input plug into the cable clamp. If necessary, loosen the retaining screw to provide room for the plug. Make certain that the plug is firmly seated in the jack, and then tighten the retaining screw to secure the clamp to the cable.
4.2. Option Switches

The Option Switches select default settings for the Baud Rate, Command Echo, Boot Delay and Disconnect Timeout. Default settings selected via the Option Switches will be used when the unit is reset to default parameters as described in Section 4.3.

**Notes:**

- Although the Option Switches select default settings for these features, the NPS-2HD configuration menus can also be used to select operating parameters as described in Section 5.
- If Option Switch settings are changed, the new settings will not be applied until the unit is reset as described in Section 4.3.

Option Switch settings are described below:

**Baud Rate:** The default baud rate for the Console Port and Modem Port.

**Boot Delay:** The default Boot Delay setting. When a boot cycle is initiated, the Boot Delay determines the length of time that the switched outlet will remain off until power is restored.

**Command Echo:** The default setting for the Command Echo for the Console Port, Modem Port and Network Port. When enabled, commands entered at your keyboard will be sent to the NPS and echoed back to your display monitor.

**Disconnect Timeout:** The default Disconnect Timeout value. This determines how long the NPS will wait for additional commands before automatically disconnecting. Note that when the NPS times out, DTR will drop, and the modem disconnect and initialize strings will be sent.

* = Factory Setting
4.3. Reset Unit to Defaults

If Option Switch settings are changed, the new settings will not be applied until the unit is reset to default settings. There are two ways to reset the unit to defaults:

**Note:** When these reset procedures are performed, all user selected parameters, including passwords and port names will be lost. Prior to performing these reset procedures, it is strongly recommended to save configuration parameters to an ASCII text file as described in Section 7.

4.3.1. Default Button / Reset Button (Local)

Typically, this method is used when you have immediate access to the installation site.

1. Simultaneously press the DEFAULT and RESET buttons, located on the NPS-2HD Back Panel.

2. Release the RESET button, wait for approximately five seconds, and then release the DEFAULT button.

4.3.2. Default Parameters Option

To reset the unit to default parameters using the General Parameters Menu's "Default Parameters" option, proceed as follows. Note that this method requires that you have already connected a local or remote PC to the unit and have accessed the command mode.

1. Access the NPS Command Mode (see Section 6.1).

3. From the General Parameters menu, type `A` and press `[Enter]`. If command confirmation is enabled, the unit will display a "Sure?" prompt. Type `Y` and press `[Enter]` to proceed with the reset procedure. After a brief pause, parameters will be reset to default values.

**Note:** If the Default Parameters function is invoked via the Network Port, the IP Address will *not* be reset. If this function is invoked via the Console Port or Modem Port, the IP Address *will* be reset.
4.4. Console Port Connection

The Console Port is a male, DB9 connector, wired in a DTE configuration (similar to an AT computer), which is used for connection to a local PC or control device. Appendix A describes the Console Port interface.

4.5. Connecting an External Modem

When connecting directly to an external modem, use a standard DB9 AT to Modem cable. Section 5.4 describes the procedure for defining the modem command strings. Appendix A describes the modem port interface.

4.6. Connecting the Network Cable

The Network Port is an RJ45 Ethernet jack, for connection to a TCP/IP network. Connect your 10Base-T cable to the Network Port. Before attempting to access the unit via network, please assign the IP Address, Gateway Address and Subnet Mask as described in Section 5.6.

Note: The NPS-2HD features a 10BaseT interface. When connecting the NPS to a 100BaseT interface, note that most router switches will autosense to determine if the device is 100BaseT or 10BaseT and then configure the network interface accordingly. If your router switch does not auto-configure for 10BaseT vs. 100BaseT, then the network interface port must be manually set to 10BaseT.
5. Configuration

5.1. System Mode and User Mode

In order to restrict access to sensitive command functions, the NPS-2HD features two separate operating modes; System Mode and User Mode.

The System Mode allows access to all configuration menus, command functions and status screens. When the System Mode is active, Boot/On/Off commands can always be directed to either of the two switched outlets, even if each plug has been assigned a separate password. The System Mode Status Screen shows On/Off conditions for both switched outlets, and lists currently defined system parameters.

The User Mode allows limited access to command functions and status screens; users are not allowed to access configuration menus. When the User Mode is active, Boot/On/Off commands can only be directed to the specific outlet(s) allowed by the User Password entered at login. If a different User Password is assigned to each NPS outlet, then a user who accesses the NPS using the password for Plug 1 is not allowed to boot or switch Plug 2. On the other hand, if the same User Password is assigned to both NPS outlets, then that user will be able to direct commands to both plugs. The User Mode Status Screen only shows conditions at the outlet(s) owned by the User Password; system parameters are not displayed.

When properly configured, the NPS will display a password prompt when the unit is contacted via the Console Port, Modem Port or Network Port. The password entered at this prompt determines whether the unit will start-up in System Mode or User Mode. If the System Password (defined via the General Parameters menu) is entered, the System Mode will be active. If the User Password (defined via the Plug Configuration Menus) is entered, the User Mode will be active.

If the System Password is not defined, the NPS-2HD will not display the password prompt, and will always start-up in System Mode. Once the System Password has been defined, individual users can be granted access by assigning passwords to the NPS's two switched plugs as described in Section 5.5.
5.2. Communicating with the NPS

In order to configure the unit or invoke command functions, the user must first connect to the NPS and access the command mode.

1. The NPS-2HD is transparent to parity and will accept 7 or 8 bit characters, but will always answer back at 8 bits, no parity. Make certain your communication program (e.g. ProComm or HyperTerminal) is set for the appropriate baud rate, bits and parity.
   a) **Via Modem:** Start your communications program. Dial the external modem connected to the NPS. Wait for the Connect message and proceed to Step 2.
   b) **Via Local PC:** Start your communications program and then press [Enter].
   c) **Via Network:** During initial configuration, the NPS cannot be accessed via the Network Port. After network parameters have been defined (see Section 5.6), the unit may then be accessed via network as described in Section 6.1.

**Note:** Only one port can access the command mode at a given time. When communicating via the Console Port or Modem Port, always make certain to disconnect (using the /X command) when you have finished. If the Console Port or Modem Port are busy, you will not be able to access the command mode via the Network Port. For more information, please refer to Section 6.8.

2. **Password:** If the System Password has been defined, the unit will display the Password Prompt. Key in either the System Password or User Password, and press [Enter]. If the system password has not been defined, the prompt will not be displayed. Note that the Password feature is case sensitive.

3. If the System Password is entered, the NPS-2HD will display the System Help Screen (Figure 5.1). If the User Password is entered, the NPS will display the User Help Screen (Figure 5.2).

Figure 5.2: User Help Screen
5.3. NPS Command/Menu Conventions

When invoking NPS-2HD commands and selecting items from configuration menus, note the following:

- To display the Help Screen, type /H [Enter].
- All NPS commands can be invoked at the NPS> command prompt, or from the General Parameters Menu, Port Parameters Menus or Network Parameters Menu.
- NPS commands are not case sensitive. All NPS commands are invoked by pressing [Enter].
- To select an item from an NPS menu, key in the number for the item and press [Enter]. To exit from a menu, press [Esc] at any time. Parameters defined up to that point will be saved.
- The ",Y" option can temporarily suppress the "Sure?" confirmation prompt. The ",Y" option is entered at the end of the command line, immediately following the command or argument. For example, to reset the network port without displaying the "Sure?" prompt, type /T,Y [Enter].

5.4. Defining General Parameters

When the "NPS>" prompt appears, type /G [Enter] to display the General Parameters menu (Figure 5.3). Note that this menu is not available in User Mode. The General Parameters menu offers the following options:

1. **System Password**: (Up to 16 characters, case-sensitive)
   When the System Password is defined, the NPS-2HD will display a prompt before allowing access to command mode. If the System Password is entered, the NPS will start-up in System Mode. To define the System Password, type 1 and press [Enter]. (Default = undefined).
   **Note**: If the System Password is not defined, the password prompt will not be displayed, and the NPS will always start-up in System Mode.

2. **Site ID**: Defines a text string (up to 32 characters) that denotes the installation site. To define the Site ID, type 2 and press [Enter]. (Default = undefined).
GENERAL PARAMETERS:

1. System Password: (undefined)
2. Site ID: (undefined)
3. Modem Init. String: ATE0M0Q1&C1&D2S0=1
4. Modem Disc. String: (undefined)
5. Baud Rate: 9600,N,8,1
6. Command Echo: Off
7. Disconnect Timeout: 2 Min
8. Command Confirmation: On
9. Automated Mode: On
10. Button Mode: On

A. Default Parameters

Enter Selection or <ESC> to Exit ...

Figure 5.3: General Parameters Menu (System Mode Only)

3. **Modem Initialization String**: To define the Modem Initialization String (up to 32 characters), type 3 and press [Enter]. For more information on the initialization string, please refer to the user's guide for your external modem. Make certain that the modem is set to auto-answer in one ring. (Default = ATE0M0Q1&C1&D2S0=1).

4. **Modem Disconnect String**: To define the Disconnect String (up to 32 characters), type 4 press [Enter], and follow the instructions in the submenu. For more information, please refer to the user's guide for your external modem. (Default = undefined).

5. **Baud Rate**: To select the baud rate for the Modem Port and Console Port, type 5 press [Enter], and follow the instructions in the submenu. Make certain to select a rate that is compatible with the external modem, and/or the device connected to the Console Port. (Default value determined by Option Switch 1; Factory Setting = 9600).

   **Note**: When this setting is changed, the new baud rate will not be applied until the user exits and then re-enters the NPS Command Mode.

6. **Command Echo**: Enables/Disables the command echo. When enabled, commands sent to the NPS will be echoed back to your PC, allowing keystrokes to be displayed. To enable/disable the echo, type 6, press [Enter] and follow the instructions in the submenu. (Default determined by Option Switch 3; Factory Setting = Disabled).
7. **Disconnect Timeout:** Determines how long the NPS-2HD will wait for additional commands. Type 7, press [Enter], and follow the instructions in the submenu. (Default determined by Option Switch 4; Factory Setting = 2 Min.).

   **Note:** It is recommended that the Disconnect Timeout should be set at the lowest acceptable value. Since only one port is allowed to access the command mode at a given time, shorter timeout values will decrease the chance of other users being shut out of command mode if a user fails to disconnect when finished communicating with the unit.

8. **Command Confirmation:** When enabled, the NPS-2HD will display a "Sure?" prompt before completing the /T, /X, /R, /BOOT, /ON, /OFF, /D and "A" commands, and will also display the System Status screen after commands are successfully completed. When disabled, the "Sure?" prompt is suppressed, and the Status Screen is not sent when commands are complete. (Default = Enabled).

9. **Automated Mode:** When enabled, the NPS will execute the /ON, /OFF, /BOOT, /D, and /X commands without displaying the confirmation prompt, status screen, or confirmation messages. This allows the NPS to be controlled by a device that generates commands to control power switching without human interaction. For more information, please refer to Section 6.5. (Default = Off).

   **Note:** When this option is enabled, NPS password security functions are disabled, and users are able to access System Level menus and control both plugs without entering a password.

10. **Button Mode:** Enables/disables the manual plug control buttons on the NPS-2HD front panel. When enabled, the NPS's two switched plugs can be toggled On and Off by pressing and holding the manual control button for approximately one second. When disabled, the manual control buttons will have no effect. (Default = On).
A. **Default Parameters:** Resets the NPS to the default values specified by the Option Switches. In addition, all menu selected parameters, including port names and passwords, will be lost. Note that if Command Confirmation is disabled, the "Sure?" prompt will not be sent.

**Note:** If the Default Parameters function is invoked via the Network Port, the IP Address is *not* reset. If this function is invoked via the Console Port or Modem Port, the IP Address *will* be reset.

After defining the General Parameters, press [Esc] to exit from the General Parameters menu.

### 5.5. Plug Parameters

The Plug Parameters menus are used to assign names and select parameters for each of the two switched outlets. There is a separate Plug Parameters menu for each outlet. Note that the Plug Parameters menus are not available in User Mode.

In addition to selecting parameters for each outlet, the Plug Parameters menus also allow you to assign an individual User Password to each plug. If the same User Password is assigned to both plugs, then that password will allow the user to direct Boot/On/Off commands to both switched plugs. If a different password is assigned to each plug, then each password will only allow access to it's corresponding plug.

To access the Plug Parameters menus from the NPS> prompt, type `/P n` and press [Enter] where `n` is the number or name of one of the two switched outlets. The Plug Parameters menu (Figure 5.4) offers the following options:

1. **Plug Name:** (Up to 16 Characters) Assigns a name to the plug. Typically, this name describes the piece of equipment that is connected to the switched outlet. When plug names are assigned, Boot/On/Off commands can be invoked using the name or number of the desired plug. (Default = undefined).
PLUG #1 PARAMETERS:

1. Plug Name: (undefined)
2. Password: (undefined)
3. Boot Delay: 5 Sec
4. Power-Up Default: On

Enter Selection or <ESC> to Exit ...

Figure 5.4: Plug Parameters Menu (Plug 1 Shown)

2. **Password:** (Up to 16 Characters) Assigns a User Password to this plug. When a User Password is assigned, the plug is then "owned" by that password. When a User Password is entered at login, the user will have access to only the plug(s) which are owned by this password. (Default = undefined).

    **Notes:**
    * If you wish to allow a single user to access both switched plugs, assign the *same* User Password to both plugs.
    * If the System Password is defined, and the plug's User Password is *not* defined, then the System Password will "own" this plug, and only the System Mode will be able to control the plug.

3. **Boot Delay:** During a Boot cycle, power to the plug is first switched off and then switched back on. The Boot Delay is the length of time which elapses between the time when power is switched off and the time that power is restored. The Boot Delay can be 1, 5, 10, 15, 30 or 60 seconds. (Default determined by Option Switch 2; Factory Setting = 5 Seconds).

4. **Power-Up Default:** Determines how this plug will react when the /D (default) command is invoked, or after a power interruption. Each plug can be automatically switched On or Off as specified by the Power-Up Default. (Default = On).

After Plug Parameters have been defined, press [Esc] to exit from the Plug Parameters menu.
5.6. Network Parameters

In order to communicate with the NPS-2HD via network, the IP Address, Subnet Mask and Gateway Address must first be defined using the Network Parameters menu. If desired, this menu also allows you to implement IP Security features, which restrict command mode access based on the user’s IP Address.

Settings for network parameters depend upon the configuration of your individual network. Please contact your network administrator for appropriate settings, and then assign parameters as described in this section.

To access the Network Parameters menu (Figure 5.5), type /N and press [Enter]. Note that this menu is not available in User Mode. The following options are available:

1. **IP Address**: Defines the IP Address for the NPS unit. Type 1 press [Enter], and follow the instructions in the submenu. (Default = undefined)

2. **Subnet Mask**: Defines the Subnet Mask for the NPS unit. Type 2 press [Enter], and follow the instructions in the submenu. (Default = undefined)

3. **Gateway Address**: Defines the Gateway Address for the NPS unit. Type 3 press [Enter], and follow the instructions in the submenu. (Default = undefined)

4. **IP Security**: Sets up the IP Security feature as described in Section 5.6.1.

5. **Mac Address**: Displays the unit’s MAC Address. Note that this item is not used to redefine the MAC Address.
5.6.1. Implementing IP Security

The NPS-2HD can be configured to restrict unauthorized IP addresses from Telneting to the unit. This allows the user to grant Telnet access to only a specific group of IP addresses, or block a particular IP address from gaining access. In the default state, the NPS accepts incoming IP connections from all hosts.

To configure the IP Security feature, proceed as follows:

1. Access the Network Parameters menu as described in Section 5.6. Note that the Network Parameters menu is not available in User Mode.

2. When the Network Parameters menu appears, type 4 and press [Enter] to access the IP Security menu (Figure 5.6).

3. The IP Security menu lists five IP Security "masks" along with the selected permit/deny action for each mask.

   a) Each Security Mask prompt is used to define a specific IP address or range of IP addresses. Each Mask Action prompt is used to define the permit/deny action for the corresponding Mask.

   b) Masks are listed in order of ascending priority; Mask 1 has the lowest priority, Mask 5 has the highest priority.

   c) Masks have a cumulative effect; high priority masks supersede the effect of lower priority masks.

   d) Each IP Address consists of a series of four eight bit numbers. The number 255 is used as a wild card.
Example 1: Deny access to all hosts except 192.1.1.5:

Security Mask #1: 255.255.255.255 Mask #1 Action: Deny
Security Mask #2: 192.1.1.5 Mask #2 Action: Permit

Since 255 is a wild card, Mask #1 blocks all IP Addresses. Mask #2 then specifically grants access to 192.1.1.5 only.

Example 2: Allow access only by addresses that begin with 192.

Security Mask #1: 255.255.255.255 Mask #1 Action: Deny
Security Mask #2: 192.255.255.255 Mask #2 Action: Permit

Since 255 is a wild card, Mask 1 blocks all IP addresses. Mask 2 then grants access to all addresses that begin with 192.

Example 3: Allow access only by addresses that begin with 192, deny access to 192.1.1.5.

Security Mask #1: 255.255.255.255 Mask #1 Action: Deny
Security Mask #2: 192.255.255.255 Mask #2 Action: Permit
Security Mask #3: 192.1.1.5 Mask #3 Action: Deny

Since 255 is a wild card, Mask 1 blocks all IP addresses. Mask 2 then grants access to all addresses that begin with 192. Finally, Mask 3 specifically blocks access by 192.1.1.5.

Note:

- Mask #5 has priority over the other four masks. If Mask #5 is set to deny access by "255.255.255.255" (all wild cards), all IP Addresses will be blocked, and you will not be able to access the NPS Command Mode via network. Access will only be allowed via the Console Port or Modem Port.

- When using the wild card address "255.255.255.255" to block access by all IP Addresses, make certain that at least one higher priority mask permits access by your IP address.
5.7. Save Configuration Parameters

After the unit has been completely configured, it is recommended to save parameters to an ASCII file as described in Section 7. This allows quick recovery in the event that the unit is reset to default parameters, or the configuration is accidentally deleted or altered.
6. Operation

6.1. Access the NPS-2HD Command Mode

Commands can be sent to the NPS-2HD via Network or modem, or from a local PC connected to the Console Port. To access the Command Mode, proceed as follows:

**Note:** Only one port can access command mode at a given time. When you have finished communicating with the unit, always make certain to disconnect using the /X command. When the Console Port or Modem Port are busy, you will not be able to access the command mode via the Network Port. For more information, please refer to Section 6.8.

1. **Contact the NPS:**
   a) **Via Network:** Telnet to the NPS unit's IP Address. For example, if the IP Address is 192.1.1.1, on a UNIX system the Telnet command would be as follows:

   ```
   $ telnet 192.1.1.1 [Enter]
   
   Notes:
   ```
   * In order to contact the NPS via telnet, you must first define the unit's Network Parameters as described in Section 5.6.
   * If the Telnet connection to the NPS is refused, this may mean that the unit is busy, or that the IP Security feature has denied the connection.

   b) **Via Modem:** Start your communications program (e.g. HyperTerminal). Dial the external modem connected to the NPS, then wait for the Connect Message.

   c) **Via Console Port:** Start your communications program and press [Enter].

2. **Password:** If the System password has been defined, a prompt will be displayed. Key in your System or User Password, and press [Enter].

3. **Disconnect:** To end the session, type /X and press [Enter] (or disconnect using Telnet software).
6.2. Displaying Plug Status

The Status Screen displays the On/Off state and selected parameters for the switched plugs. To display the Status Screen, type `/S` and press [Enter]. Note that although the `/S` command is available in both User and System Mode, the System Status Screen includes more information than the User Status Screen.

When the System Mode is active, the `/S` command will produce the screen shown in Figure 6.1, which lists status and parameters for both switched plugs, along with Console Port parameters, and modem command strings. Note that in System Mode, the `/S` command will also accept an argument which will display the User Password for each plug. To display plug passwords, access the System Mode, type `/SP` and press [Enter].

When the User Mode is active, the `/S` command will produce a different version of the status screen, which lists the status and parameters only for the plug(s) owned by the User password entered at login. If a separate User Password has been assigned to the other plug, the User Mode Status Screen will not list the status for that plug. In User mode, plug passwords cannot be displayed.

![Figure 6.1: System Status Screen (Passwords Hidden)](image)
6.3. **Boot/On/Off Commands**

These commands are used to Boot or toggle the On/Off status of the NPS's two switched plugs. If the same password has been applied to both switched plugs, commands can be directed to Plug 1, Plug 2, or both switched plugs. If a separate User Password has been assigned to each plug, then commands can only be applied to the plug that is owned by the User Password entered at log in. Plugs may be specified by name or number.

**Notes:**

- When User Mode is active, commands will only be applied to plugs owned by the User's password.
- To apply a command to both outlets, enter an asterisk (*) in place of the plug number or name. Commands can only be applied to both plugs when the unit is operating in System Mode, or when both plugs are owned by the same User Password.
- When commands are applied to both plugs, the NPS will delay for approximately 1 second between actions. For example, when switching both plugs On, the NPS will switch Plug 1 On, delay one second, then switch Plug 2 On.
- Wait for the "NPS>" prompt to appear before entering commands. The prompt will not reappear until the previous command is complete.
- Commands are *not* case sensitive. All commands are invoked by pressing [Enter].
- If command confirmation is enabled, the NPS will display the Status Screen after the Boot/On/Off commands are successfully completed.

1. **Boot Plug(s):** To initiate a Boot cycle, type `/BOOT n` and press [Enter]. Where "n" is a the number or name of the desired plug. Note that the "/BOOT" command can also be entered as "/BO".

**Examples:**

- To boot both plugs, type `/BOOT *` or `/BO *` and then press [Enter].
- To boot plug 1, type `/BOOT 1` or `/BO 1` and then press [Enter].
2. **Switch Plug(s) On:** To power-on a plug, type `/ON n` and press [Enter]. Where "n" is the number or name of the desired plug.

   **Examples:**
   - To power-on both plugs, type `/ON *` and press [Enter].
   - To power-on Plug One, type `/ON 1` and press [Enter].

3. **Switch Plug(s) Off:** To power-off a plug, type `/OFF n` and press [Enter]. Where "n" is the number or name of the desired plug. Note that the "/OFF" command can also be entered as "/OF".

   **Examples:**
   - To power-off both plugs, type `/OFF *` or `/OF *` and press [Enter].
   - To power-off a plug named POWER2, type 
     `/OFF POWER2` or `/OF POWER2` and press [Enter].

4. **Suppress Command Confirmation Prompt:** To execute a Boot/On/Off command without displaying the "Sure?" prompt, include the ",Y" option in the command line. The ",Y" option is entered immediately following the command argument.

   **Examples:**
   - To boot both plugs without displaying the "Sure?" prompts, type `/BOOT *,Y` or `/BO *,Y` and then press [Enter].
   - To power-off a plug named POWER1 without displaying the "Sure?" prompt, type `/OFF POWER1,Y` or 
     `/OF POWER1,Y` and then press [Enter].
6.4. The Default Command

The Default Command (/D) sets plugs to their default On/Off status. The default status is set using the Plug Parameters menus described in Section 5.5. To set plugs to defaults, type /D and press [Enter].

Note:
- When User Mode is active, this command will only be applied to the plug owned by the User's password. The command will not be applied to a plug that is owned by another User Password.
- When the System Mode is active, this command will be applied to both plugs.
- This command will always be applied to all owned plugs. It cannot be directed only to a specific plug.

6.5. The Automated Mode

The Automated Mode allows the NPS-2HD to perform On/Off/Boot/Default/Exit commands, without displaying menus or generating response messages. Automated Mode is designed to allow the NPS to be controlled by a computer (or another automatic system) which can generate commands to control power switching functions without human intervention.

When the Automated Mode is enabled, the /ON, /OFF, /BOOT, /D and /X commands are executed without a "Sure?" confirmation prompt and without command response messages; the only reply to these commands is the "NPS>" prompt, which is displayed when the command is complete.

Note: When Automated Mode is enabled, all NPS password security functions are disabled, and users are able to access System Level command functions (including the configuration menus), and control both plugs without entering a password. If you need to enable the Automated Mode, but want to restrict network access to NPS configuration menus, it is recommended to enable and configure the IP Security Function as described in Section 5.6.1.
To enable/disable the Automated Mode, access the NPS General Parameters menu, and proceed as described in Section 5.4. When the Automated Mode is enabled, NPS functions will change as follows:

1. **All Password Security Suppressed:** When a user attempts to access the NPS command mode, the password prompt will not be displayed at either the Network Port, Modem Port, or Console Port. Unless restricted by the IP Security Function, all users will be allowed to access System Level command functions and control both plugs. At the Console Port, all commands are immediately accepted, whether the port is awake or asleep.

2. **Status Screen Suppressed:** The status screen will not be automatically displayed after commands are successfully executed. Note however, that the /S command can still be invoked to display the status screen as required.

3. **"Sure?" Prompt Suppressed:** All commands are executed without prompting for user confirmation.

4. **Error Messages Suppressed:** If the [Enter] key is pressed without entering a command, the NPS will not respond with the "Invalid Command" message. Note however, that an error message will still be generated if commands are invoked using invalid formats or arguments.

All other status display and configuration commands will still function as normal.
6.6. Other Commands

6.6.1. Login as Different User

The /R command is used to re-login using a different password. When invoked, the NPS will display the password prompt, allowing the user to enter a different password in order to access the other plug or System Level command functions. The /R command is typically used to switch from User Mode to System Mode.

The /R command is available in both System Mode and User Mode. To login as a different user, type /R, press [Enter], and then key in a different valid password at the prompt. To suppress the "Sure?" prompt, type /R,Y [Enter].

6.6.2. Reset Network Port

The /T command is used to reinitialize the NPS Network card. The /T command is not available in User Mode. To reset the Network Port, type /T and press [Enter]. To suppress the "Sure?" prompt, type /T,Y [Enter].

Note: The /T command can only be issued via the Console Port or Modem Port. The /T command cannot be invoked via the Network Port.

6.6.3. Exit / Disconnect

To exit from the NPS Command Mode and discontinue connection to the unit, type /X and press [Enter]. The NPS will display the "DISCONNECT" message. To suppress the "Sure?" prompt, type /X,Y [Enter].

Note: Only one port may access the NPS command mode at any given time. In order to allow access to the NPS unit via other ports, always exit from the command mode when you are finished communicating with the unit. For more information, please refer to Section 6.8.
6.7. Manual Operation

In addition to the command driven functions, the NPS's two switched plugs can also be toggled On and Off manually. To manually toggle a plug On or Off, press the appropriate Manual Control Button, and hold it down for approximately one second; the corresponding plug will be toggled On or Off. Note that if desired, the Manual Control Buttons can also be disabled via the General Parameters menu as described in Section 5.4.

6.8. Operating Tips

When connecting to the NPS-2HD via network, modem or console port, the following factors should be kept in mind:

1. **One Connection at a Time:** Only one port can access the command mode at a time. Therefore, it is recommended that users should always disconnect using the /X command when finished communicating with the unit. When a command port is busy, the NPS-2HD will react as follows:
   
   a) **Network Port Busy:** If a second user attempts to connect via the Modem Port, the NPS will send a busy message. If a second user attempts to connect via the Console Port, the port will not wake.
   
   b) **Modem Port Busy:** If a second user attempts to connect via the Network Port, the connection will be refused. If a second user attempts to connect via the Console Port, the port will not wake.
   
   c) **Console Port Busy:** If a second user attempts to connect via the Network Port, the connection will be refused. If a second user attempts to connect via the Modem Port, the Console Port will disconnect and the Modem Port will be granted access; the Modem Port has priority over the Console Port.

2. **Ping Packet Size:** The NPS will not accept Ping Packets larger than approximately 1000 bytes.

If you have any questions regarding configuration or operation of the NPS, please contact WTI Technical Support as described in Appendix C.
7. Saving and Restoring Configuration Parameters

After the NPS-2HD has been properly configured, parameters can be downloaded and saved as an ASCII text file. Later, if the configuration is accidentally altered, the file with the saved parameters can be uploaded to automatically reconfigure the unit without the need to manually assign each parameter.

Saved parameters can also be uploaded to other NPS-2HD units. This allows rapid set-up when several units will be configured with the same parameters.

The "Save Parameters" procedure can be performed from any terminal emulation program (e.g. ProComm, Crosstalk, Hyperterminal, etc.), which allows downloading of ASCII files.

7.1. Sending Parameters to a File

1. Start your communications program and access the NPS-2HD command mode using the System Level Password.

2. When the NPS command prompt appears, type `/DL` and press [Enter]. The NPS will prompt you to prepare your communications program. Set up your communications program to receive an ASCII download, and specify a name for the file that will receive the saved parameters (e.g. NPS.PAR).

3. When the communications program is ready to receive the file, return to the NPS command mode, and press [Enter] to proceed.

4. The NPS will send a series of ASCII command lines which specify the currently selected NPS parameters.
7.2. Restoring Saved Parameters

This section describes the procedure for using ProComm to send saved parameters to the NPS-2HD.

1. Start your communications program and access the NPS command mode using the System Level Password.

2. Configure your communications program to upload an ASCII text file.

3. Upload the file with the saved parameters. If necessary, key in the file name and directory path.

4. When the upload is complete, make certain to terminate the communications program's upload mode.

   **Note:**
   - The current On/Off status of each NPS-2HD plug will not be saved or restored. However, the selected default On/Off setting for each plug will be saved and restored.
   - When the configuration file is sent to the NPS-2HD via telnet, the unit's IP Address, Subnet Mask, and Gateway Address cannot be altered.

5. Type `/SP` and press [Enter], the NPS-2HD will display the Status Screen with passwords revealed. Check the Status Screen to make certain that saved parameters have been restored.
A. Interface Descriptions

A.1. Console Port Interface

![Console Port Interface Diagram]

*Figure A.1: Console Port Interface*

A.2. Modem Port Interface

Figure A.2: Modem Port Interface
B. Specifications

Power Input/Output: Model NPS-2HD (115 VAC)
AC Inputs: Two (2); Bus 1 and Bus 2.
Input Voltage: 105 - 120 VAC, 60 Hz
Input Connector: IEC-320-C19 Inlet
AC Outputs: Two (2); Bus 1 and Bus 2
Output Connector: IEC-320-C20 Outlet
Load: 20 Amps Each Bus

Modem and Console Port Interface:
Connector: DB9M, RS232C, DTE
Coding: Serial ASCII, 8 Bits, No Parity

Physical / Environmental:
LED Indicators: ON, RDY, RXD, DCD, NET, Outlet ON (1 - 2)
Size: 1.75" H x 19.0" W x 7.5" D (1RU)
Weight: 10 Lbs. Shipping Weight
Operating Temperature: 0°C to 45°C
Humidity: 10 - 90% RH, Non-Condensing
C. Customer Service

Customer Service hours are from 8:00 AM to 5:00 PM, PST/PDT, Monday through Friday. When calling, please be prepared to give the name and model of the unit, its serial number and a description of its symptoms. If the unit should need to be returned for factory repair it must be accompanied by a Return Authorization number from Customer Service.
